Testing setup captures modal response

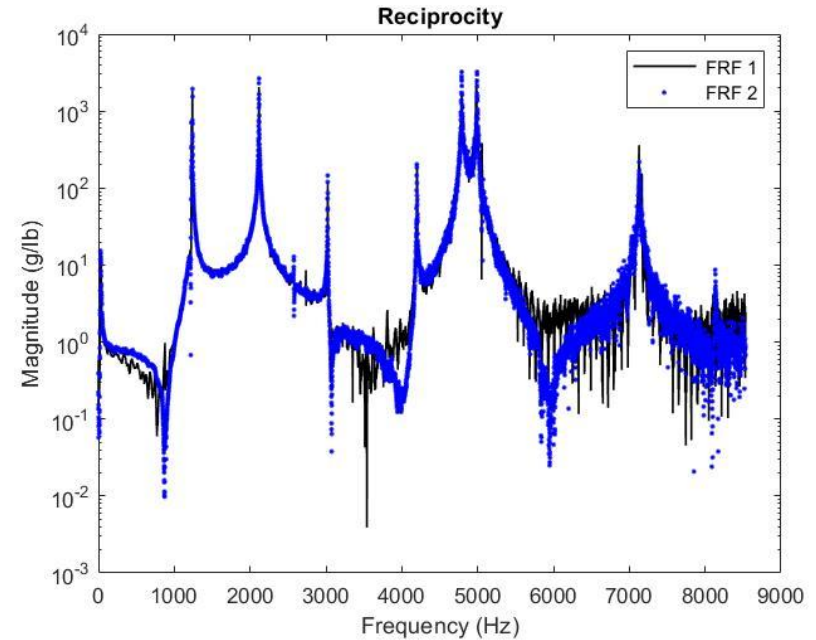

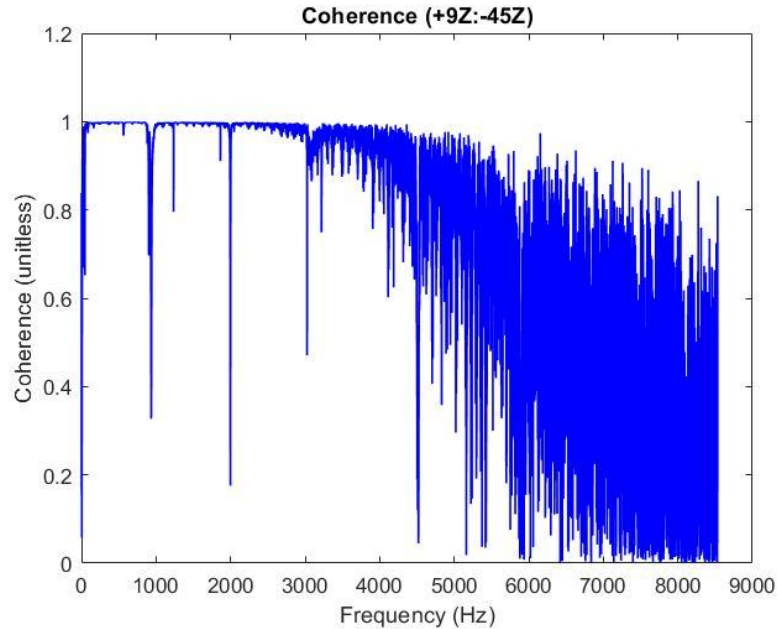

- Experimental procedure derived from lab 4 guidelines
- 45 test points
- Exponential windowing
- Steel hammer tip

Steel tip hammer and exponential window produced an appropriate response

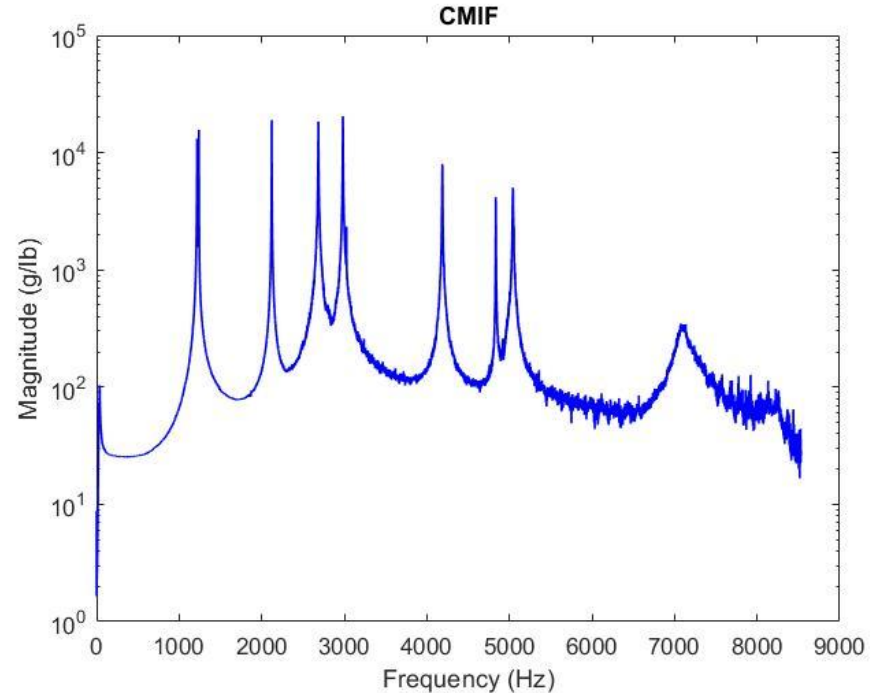

Reciprocity Test and Coherence suggest good correlation below 5000 Hz

Natural frequencies identified by peak picking

Measured frequencies:

1. 1240 Hz
2. 2122 Hz
3. 2687 Hz
4. 2984 Hz
5. 4189 Hz
6. 4836 Hz

Discussion

- Poor coherence at higher frequencies
- Frequent double hits with steel tip
- Strain hardening from waterjet
